

# Compressed Air Treatment

Twin Tower Desiccant Dryers  
TW, TWP & TWB Series

ENGINEERING YOUR SUCCESS.

# Parker Twin Tower Desiccant Dryers

For over 50 years, Parker Hannifin's Industrial Gas Filtration and Generation Division has established itself as an industry leader in the design, development and manufacture of a wide range of filtration and separation products. Designed to meet the needs of global customers through a dedicated focus on key market sectors, Parker's products deliver a unique combination of innovation and excellence in the most demanding applications, helping our valued customers to maximize the productivity and profitability of their manufacturing and process operations. Parker's engineering expertise and broad range of core technologies uniquely positions the company to help solve the world's greatest engineering challenges, while delivering real and lasting value to every customer.

## TW Series

Parker TW Series Heatless Desiccant Air Dryers remove water vapor from compressed air through a process known as Pressure Swing Adsorption. A standard pressure dewpoint of -40°F (-40°C) is attained by directing the flow of saturated compressed air over a bed of desiccant. The desiccant bed is regenerated by using dry purge air from the system.

## TWP Series

Parker TWP Series Externally Heated Desiccant Air Dryers operate similarly to the TW series to achieve a pressure dewpoint of -40°F, but the design includes a heat source to assist the purge air during regeneration. This is called Thermal Swing Adsorption and helps reduce the energy required to regenerate the desiccant bed.

## TWB Series

Parker TWB Series Blower Purge Desiccant Air Dryers achieve a pressure dewpoint of -40°F by using Blower Regeneration technology. In this design, the dryer uses a heat source and a blower to push large volumes of ambient air across the desiccant bed during regeneration, instead of using dry purge air from the system. As a result, the TWB design is the most energy efficient of the Twin Tower dryers in Parker's offering.

## Filter Package Schematic

### Package B

(Standard on models 801 & smaller)  
(Optional for models 1001 & larger)

Includes dryer with factory installed pre-filter and after-filter with system bypass.

### Package F

(Standard on models 1001 & larger)

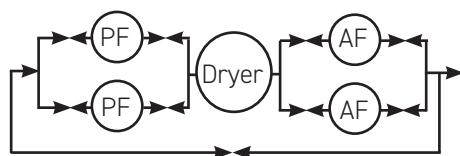

Includes dryer with factory installed pre-filter and after-filter.

### Package D

(Optional for all models)

Includes dryer with factory installed dual selectable pre and after-filters with system bypass.

## PowerLoc® Energy Management System

Energy savings of up to 80% can be achieved with the proven PowerLoc® energy management system. Regeneration requirements are dependent on flow, pressure and temperature. The PowerLoc® system allows the cost of drying compressed air to be matched exactly to your plant conditions. PowerLoc® controls the drying cycle by continuously reacting to the loading under which the dryer is operating and minimizes the energy input required. As dryers rarely operate at full rated capacity all of the time (eg. during shift work and periods of low demand), this energy management system can provide considerable savings.

The Advanced Controller is designed to accomodate Parker's PowerLoc® Energy Management System. Flashes green when in energy saving mode.

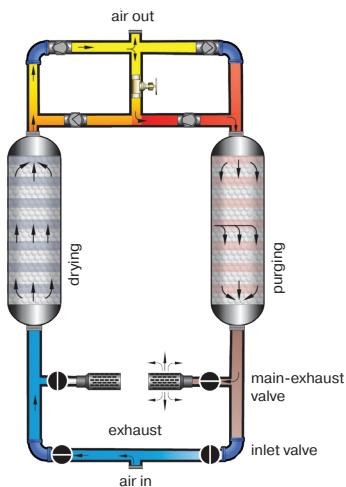

## Compressed Air Quality to ISO 8573.1:2010

The Industry Standard Method for Specifying Compressed Air Cleanliness  
(in accordance with ISO 8573-1 2,2,2)

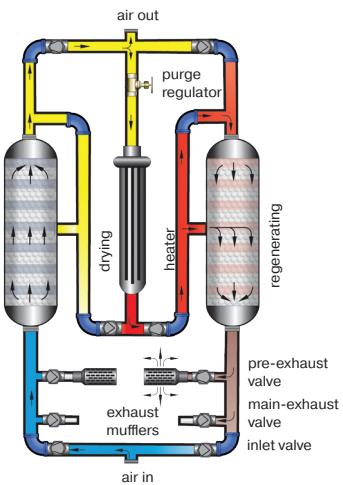

# How it Works

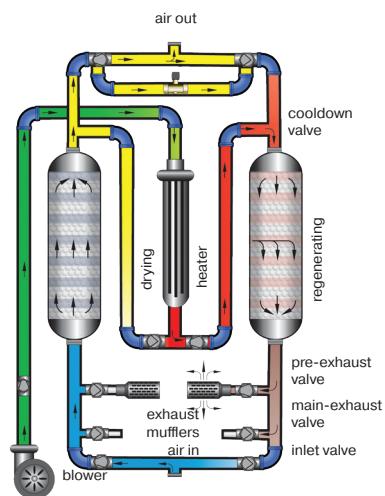

**TW Series**

**TWP Externally Heated with Patented Multi-Port**

**TWB Series Blower Purge**

The **TW Series** is the simplest desiccant air dryer in our offering, the dryer uses heatless pressure swing adsorption for drying the compressed air to -40°F PDP. The pressure swings between a left and a right tower typically on a cycle of 5 to 10 minutes. During regeneration, a percentage of the dry compressed air is used for purge, this helps regenerate the fully adsorbed desiccant.

The **TWP Series** adds a heater to the regeneration process, this is called heated regeneration or thermal swing adsorption. The desiccant dryer is still designed to achieve -40°F PDP, but it includes a heater to reduce the amount of purge air required during regeneration. The regeneration time for the TWP series is extended to 8 hours to complete a full cycle.

The **TWB Series** is the most advanced design in our desiccant dryer offering, it includes a heater and a blower for regeneration of the desiccant bed. This process is known as blower regeneration and is the most energy efficient option available. Instead of using dry compressed air for the purge cycle, a blower pushes hot ambient air across the desiccant bed during regeneration. In order to cool down the desiccant bed, a small percentage of purge air is used at the end of the cycle before the towers switch.

## Types of Regeneration

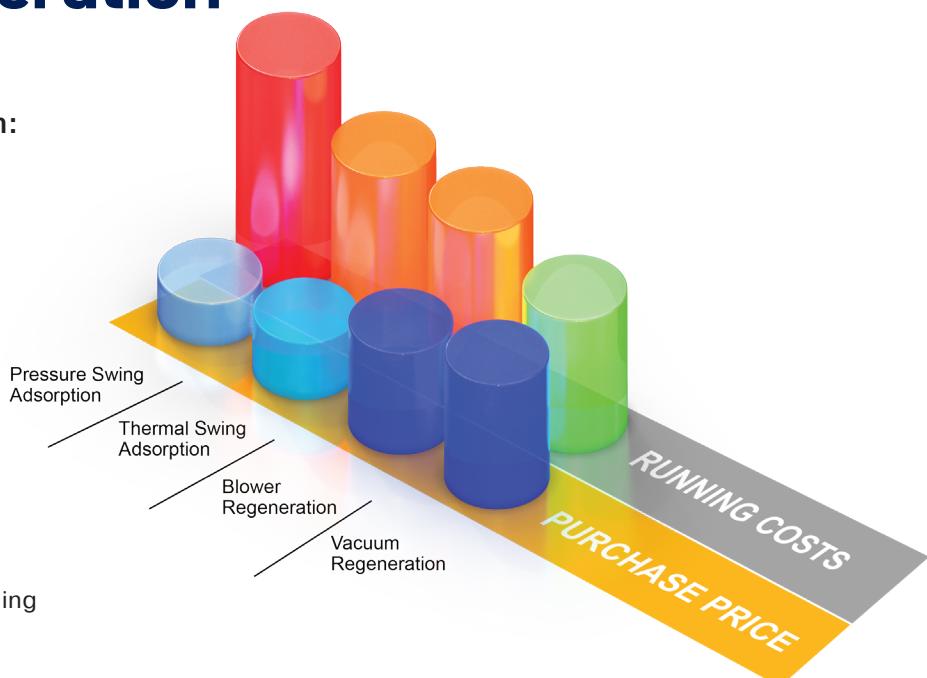

Typically one of four different methods is used for regeneration:

- Pressure Swing Adsorption
- Thermal Swing Adsorption
- Blower Regeneration
- Vacuum Regeneration

The regeneration method used by an adsorption dryer usually has a direct correlation to its purchase price.

The running costs associated with an adsorption dryer are usually linked to the regeneration method.

The purchasing decision for an adsorption dryer is often based upon the dryer's running costs and the upfront purchase price.

Model	Flow Range @ 100 psi g (7 bar g)	Dewpoint	Design Pressure	Pressure Relief Valve Setpoint	Max. Operating Pressure	Min. Operating Pressure	Max. Inlet Temp.	Min. Inlet Temp.	Standard Electrical Supply
<b>TWB201 - TWB1501</b>	200 - 1500 scfm	-40°F (-40°C) Standard	150 psig (10.3 barg)	165 psig (11.4 barg)	150 psig (10.3 barg)	80 psig (5.5 barg)	120°F (49°C)	50°F (10°C)	460V/3Ph/60Hz - 575V/3Ph/60Hz (Optional)
<b>TWB2001 - TWB7501</b>	2000 - 7500 scfm	-40°F (-40°C) Standard	150 psig (10.3 barg)	150 psig (10.3 barg)	135 psig (9.3 barg)	80 psig (5.5 barg)	120°F (49°C)	50°F (10°C)	460V/3Ph/60Hz - 575V/3Ph/60Hz (Optional)

### Notes

- Above information should be used as a guideline. Flows are at 100 psig inlet pressure, 100°F (38°C) inlet temperature and 100°F (38°C) ambient temperature. For specific applications, please consult Parker Applications Engineering.
- Weight includes desiccant (shipped loose TWB2001 and up).
- Pressure relief valve variance +/- 10%.

Temperature Correction Factor CFT										
Maximum Inlet Temperature (C1)	°F	80	85	90	95	100	105	110	115	120
	°C	27	29	32	35	38	41	43	46	49
	CF	1.17	1.17	1.17	1.15	1.00	0.87	0.76	0.66	0.58

### Correction Factors

To obtain dryer capacity at new conditions, multiply nominal capacity x C1 x C2.

Pressure Correction Factor CFP												
Minimum Inlet Pressure (C2)	psi g	80	85	90	95	100	105	110	115	120	125	
	bar g	5.51	5.86	6.21	6.55	6.89	7.24	7.58	7.93	8.27	8.62	8.96
	CF	0.83	0.87	0.91	0.96	1.00	1.04	1.09	1.13	1.17	1.22	1.26
