Quincy Condensate Purifiers

Environmentally Responsible Products

Compressed air is one of the most common and versatile utilities in use today. Raw compressed air, however, contains high concentrations of contaminated gasses, dirty water and various lubricants. If allowed to enter a compressed air distribution system, these pollutants will slow down production, ruin processes, and damage air operated equipment. To prevent these occurrences from causing unscheduled business interruptions, commonly referred to as "down time", most facilities employ such downstream air purification devices as aftercoolers, filters, and air dryers. The unavoidable by-product of such devices is a nasty brew of contaminate laced condensate. Oily, contaminated condensate is considered a hazardous material and should be handled and disposed of as such.

Over the years, commercial and industrial sites have struggled with how to properly dispose of this hazardous waste. Many have found that dumping condensate down the sewer, on to the ground, or into a lake, river or stream violates several environmental regulations and eventually results in significant penalties.

Section 309 of the Federal Water Pollution Control Act provides for fines of not less than \$2,500 per day to \$25,000 per day, or jail time, or both for first time violators. Such penalties can be assessed against the delinquent company and/or the person or persons responsible for plant operations and maintenance.

Quincy Condensate Purifiers use an environmentally responsible filtration process to remove contaminants from condensate. Contaminates are trapped in a special filter cartridge. The lightweight filter cartridge can be easily disposed of in accordance with local regulations.

Quincy Condensate Purifiers protect commercial and industrial sites and personnel from costly fines and penalties while helping to protect our waterways for future generations.

Quincy Condensate Purifiers

QCS Operation

1. Untreated condensate flows into the integrated pressure relief chamber
2. Condensate then flows into the 1st stage prefilter where bulk contaminants and oil are trapped in the oliophilic filter material
3. The prefiltered condensate is then directed into the polishing filter cartridge where the remaining contaminants are removed
4. Clean water exits the disposable cartridge rises to the outlet port and is discharged from the QCS purifier

To use the QCS Product Selector Chart, first locate either your compressor horsepower (for multiple compressors use the total system horsepower) or the net flow rate of your compressed air system. Follow the row to the right and locate the column with the appropriate compressor type and lubricant for your particular application (i.e. piston compressor with synthetic lubricant) and you will instantly know the correct QCS model size for your compressor type. If you feel that the condensate emulsion for your given application, your regional location, total application volume or any other specific needs may have a significant impact on the application or installation, please consult your Quincy Compressor representative for details and sizing assistance.
